

Lists Review

```
def main():  
    lst = [1, 2, 3]  
    print(lst)
```

lst 

Text in Python

Text in Python is represented as a
String

Revisiting Strings

```
name = "Brahm"
```

Revisiting Strings

```
name = input("Name: ")
```

```
$ python my_program.py  
Name: Brahm
```

Revisiting Strings

```
print("Hi, " + name + "!")
```

```
$ python my_program.py  
Name: Brahm  
Hi, Brahm!
```

name → "Brahm"

Revisiting Strings

`num_str = "42"`

`num = 42`

We've been shortchanging strings a little bit.

Strings are *sequences*

S = "lightsaber"

0 1 2 3 4 5 6 7 8 9

```
length = len(s) # 10
```

Strings are *sequences*

S = "lightsaber"
0 1 2 3 4 5 6 7 8 9
↑

ch = s[2]

Strings are *sequences*

S = "lightsaber."
0 1 2 3 4 5 6 7 8 9
↑

ch = s[-1]

Strings are *sequences*

S = "lightsaber."
0 1 2 3 4 5 6 7 8 9
↑

ch = s[len(s) - 1]

Strings are *sequences*

`s = "lightsaber"`

A diagram showing the string "lightsaber" with indices 0 through 9 below each character. A blue line segment with dots at each end spans from index 1 to index 6, representing the slice s[1:7].

`part = s[1:7]`

Strings are *sequences*

`s = "lightsaber"`

A diagram showing the string "lightsaber" with indices 0 through 9 below each character. A blue line segment with dots at each end spans from index 1 to index 9, representing the slice s[1:].

`part = s[1:]`

Strings are *sequences*

`s = "lightsaber"`

A diagram showing the string "lightsaber" with indices 0 through 9 below each character. A blue line segment with dots at each end spans from index 0 to index 6, representing the slice s[:7].

`part = s[:7]`

```
def main():  
    example = "Python"  
  
    length = len(example)  
    print(length)  
  
    first_char = example[0]  
    print(first_char)  
  
    for i in range(length):  
        ch = example[i]  
        print(ch)
```

example		→	"Python"
length		→	6
first_char		→	"p"
i		→	5
ch		→	"n"

```
$ python3 strings.py  
6  
p  
p  
y  
t  
h  
o  
n
```

```
def main():  
    example = "Python"  
  
    length = len(example)  
    print(length)  
  
    first_char = example[0]  
    print(first_char)  
  
    for i in range(length):  
        ch = example[i]  
        print(ch)
```

```
$ python3 strings.py  
6  
P  
P  
y  
t  
h  
o  
n  
$
```
